Forecasting & Valuation

Objective of the forecasting exercise

- to develop objective and realistic expectations of future value-relevant payoffs
 - ⇒ unbiased predictions (neither optimistic nor pessimistic → sensitivity analysis)
pro forma F/S should assume items will grow in sales
need to make consistent assumptions in the relation between items in the *pro forma* F/S (i.e., the F/S represent an integrated system)
- use external information to ensure that assumptions are realistic

Key Steps:

- ❑ Sales forecast
 - external environment & macroeconomic forecasts
 - Industry dynamics & forecasted changes
 - firm-specific characteristics
- ❑ Forecast of 'Core Operating Income from Sales'
 - forecast asset turnover and calculate NOA implied by forecasted sales and ATO
 - revise sales forecast (if n f 'asset constraints' and iterate
 - forecast gross profit mar <https://eduassistpro.github.io/>
 - forecast core operating expenses (e.g., \$ ciation, advertising, R&D)
 - forecast the tax rate applicable to 'core come from sales'
- ❑ Forecasts of 'Core Other Operating Income' and 'Unusual Operating Income'
- ❑ Calculation of 'Operating Income (OI) after tax
- ❑ Forecast OA and OL to obtain (confirm) NOA
- ❑ Calculate RNOA, FCF, ReOI and value the firm (FCF and AE valuation models; WACC)

Key Steps (cont)

- ❑ Forecast of Comprehensive Income (CI)
 - forecast of financial leverage (FLEV) and determination of NFO
 - forecast of net borrowing cost (NBC) and determination of NFE
 - calculation of comprehensive income (CI)
- ❑ Forecast of Shareholders' Equity = NOA - NFO
- ❑ Forecast of Dividends
- ❑ Forecast of Residual Income
 - determination of 'cost of equity capital'
 - calculation of abnormal earnings (residual income) = $CI - k_e * BV_{t-1}$
- ❑ Selection and justification of terminal growth rate, g
- ❑ Valuation based on
 - Abnormal Earnings (Residual Income) valuation model
 - Discounted Dividend (DDM) valuation model
- ❑ Conduct 'sensitivity analyses'

PART 3 – Alternative Approach to Valuation: Use of ‘Heuristics’

⇒ ‘multiplier approach’

Implementation of the formal AE valuation model (and also the DDM and FCF models) is a relatively involved and complex process

Assignment Project Exam Help

The alternative, both less rigorous and focus on multipliers such as the P/E or M/B ratios.

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

In general terms, the "multiplier approach" can be expressed as:

$$P_0 = X \cdot M$$

where M is the multiplier and X is the valuation basis (e.g., earnings, book value)

The two most commonly cited multipliers are:

- ❑ Market-to-Book (M/B) ratio (price-to-book ratio)
- ❑ Price-Earnings (P/E) ratio

The P/E ratio is clearly a flows-based (income statement) measure whereas the M/B ratio is a stock-based (balance sheet) measure.

Of these, the P/E ratio typically runs on <https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

	Coles (price ≈ \$30)	Woolworths (price ≈ \$40)
Market-to-Book (M/B)	= = 9.18	= = 5.70
Price-Earnings (P/E)	= 24.56	

❑ Market-to-Book (M/B) ratio (price-to-book ratio)

Abnormal Earnings Valuation Model

+

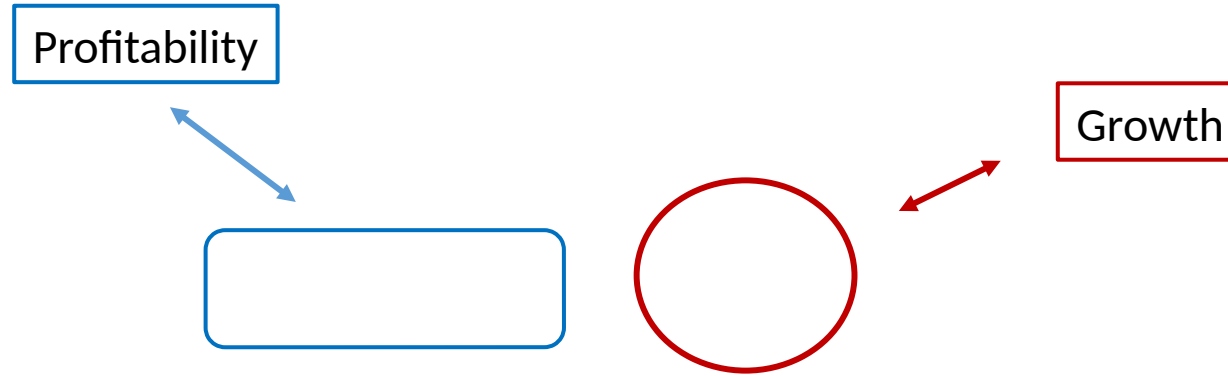

$$(CI - k * BV_{t-1}) = (CI - k * BV_{t-1}) - (CI - k * BV_{t-1}) = (ROCE - k) * BV_{t-1}$$

Assignment Project Exam Help

> does **not** require <https://eduassistpro.github.io/> th' (AEG), although it does not preclude it either Add WeChat edu_assist_pro

where $AEG \rightarrow AE_t > AE_{t-1}$

PART 4 – Heuristics (cont)

❑ Price-Earnings (P/E) ratio (price-to-book ratio)

- initially assume the firm's earnings are expected to remain constant in perpetuity

$$\Rightarrow P_0 = \frac{E_0}{k} \rightarrow = \frac{E_0}{k} \text{ or } P_0 = E_0$$

- alternatively, assume that $t \rightarrow \infty$ constant rate, g

$$\Rightarrow P_0 = \frac{E_0}{k - g}$$

- reveals immediately that in these two 'simplistic worlds', the P/E ratio is related to
- risk as reflected in the firm's cost of equity capital (k)
 - growth in future earnings (g)

However, these two factors (risk and growth) have been found by empirical studies to explain only slightly more than 50% of the difference in P/E ratios across firms.

→ in the empirical domain, other factors clearly influence the magnitude of the P/E ratio.

Assignment Project Exam Help

additional factors often advanced to explain the P/E ratio include **earnings persistence** and choice of **accounting**

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

re: risk

in equilibrium, investors will impose a greater risk premium on firms they perceive to have greater business risk.

as such, k_e will be higher for firms with greater risk and the P/E ratio (related to $1/k_e$) will be lower, all else held equal.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

re: growth

Add WeChat edu_assist_pro

as is also clear from the theoretical models, firms with greater earnings growth will have higher P/E ratios, all else held equal, because market price will reflect the anticipated higher future earnings.

note, however, the market only prices *anticipated permanent growth*

re: earnings persistence

- a firm's P/E ratio will deviate from its the theoretical model if current period earnings are a poor predictor of expected future (permanent) earnings e.g., if the current period earnings include either an extraordinary gain or an extraordinary loss.
- these transitory components should lead to only a temporary change in the P/E ratio.
- alternatively, a permanent change in earnings should not significantly affect the P/E ratio because both the earnings figure and the market price will be affected in the same direction

Assignment Project Exam Help

<https://eduassistpro.github.io/>

re: accounting policy choice

Add WeChat edu_assist_pro

- when otherwise identical firms select different policies for *cosmetic reasons alone*, these differences will be reflected in P/E ratios e.g., a firm selecting a more conservative accounting policy (accelerated depreciation) will report lower earnings than a firm using less conservative policies (straight-line depreciation).
- if the market assesses the only difference between the two firms to be their choice of accounting policies, the firm selecting the more conservative policies will have the higher P/E ratio (since the market prices will be the same)

Application of the multiplier approach:

Valuation developed through 'fundamental analysis' and implemented through the 'abnormal earnings', 'DDM, and 'FCF' valuation models requires detailed, multi-year forecasts

An alternative approach is to base valuation on multipliers such as the P/E and M/B ratios

Such an approach simply requires estimate the appropriate value for the selected multiplier and for the estimation (earnings or book value)

Perhaps the greatest advantage of using the "multiplier approach" to valuation is that the P/E and M/B ratios of comparable firms can be used as the basis of the valuation

Having selected the appropriate comparable firm, the investor (analyst) implicitly assumes that the pricing of the comparable is applicable to the firm of interest

Unfortunately, application of pricing multiples is not as simple as it might seem. Reasons for the difficulty include:

- the need to identify an appropriate comparable(s)
- the question of whether valuation should be based on actual figures (past performance) or forecasted figures (expected future performance)
- the need to understand why multiples vary and of the determinants of the multiples, in order to make appropriate

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

re: choice of comparable firms

- empirical research suggests that industry membership is the best basis for selecting comparable firms
- one reason advanced as to why industry membership provides the most effective comparisons is that firms in the same industry usually experience similar profitability, face similar risks, and grow at similar rates
- one problem however, is that there is a wide variation in growth rates within many different industry segments
- one way of dealing with this problem is to use industry average multiples. Another is to search for the firm within the industry that is most similar

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

re: forecasts versus realized

- market prices reflect future expected performance by definition.
- use of historical data in the denominator of a price multiple is justified only if history is viewed as a reasonable indicator of the future (*trailing P/E*)
- if a reliable forecast is available, it would generally be preferred as the basis for a multiple (*forward P/E*)
- *trailing P/E* multiples can be distorted by one-time gains or losses or other unusual performance.
- *forward* multiples (based on forecasts) can also be distorted but are less likely to include one-time gains/losses

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

re: adjustments

- P/E and M/B ratios can vary substantially across apparently similar firms for a number of reasons e.g.,
 - P/E ratios can vary because of differences in risk, expected future (abnormal) earnings, and accounting policy choice
 - M/B ratios can vary because of differences in future ROEs, growth in book value, and risk
- the differences that exist between apparently closely related firms, render pricing based on multiples unique.
- the investor (analyst) can attempt to mitigate the effect of the differences either through using industry averages or by attempting to make "informed" adjustments

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

PART 5 – Heuristics (cont)

Finally, returning to the key issue of ‘growth’, as discussed it is ‘growth in residual income (abnormal earnings) that matters for valuation.

where abnormal earnings growth (AE_{G_t}) = $AE_t - AE_{t-1}$

Assignment Project Exam Help

Note – growing earnings is not in abnormal earnings!

<https://eduassistpro.github.io/>

To illustrate:

Add WeChat edu_assist_pro

consider a firm with S/E of \$100 million that current earns \$12 million per year, pays dividends of \$12 million per year, and has a COEC of 10%

suppose it raises additional equity capital of \$20m and invests it in a project that produces \$1.5m earnings per year and then increases its dividend to \$13.5 million

What will happen to earnings and the value of the firm after the issuance?

Current	Revised
Earnings = 12	Earnings = $12 + 1.5 = 13.5$
BV = 100	BV = 120
AE = $12 - 0.10(100) = 2$	AE = $13.5 - 0.10(120) = 1.5$
V = 100 +	

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu_assist_pro

The firm's earnings have grown but its abnormal earnings have not – the new investment does not promise a return equal to COEC

→ 'value added' has been reduced 100 → 120 *versus* 120 → 135

note: normal forward $P/E =$ but the trailing $P/E =$

why? the trailing P/E is taken one year earlier and has one extra year of return i.e.,

trailing $P/E =$ assumes that dividends are reinvested to earn k

Ultimately, the 'abnormal earnings valuation model' can be recast in terms of 'abnormal earnings growth'

$$V_0 =$$

and

$$P/E = -$$

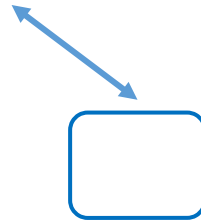

Assignment Project Exam Help

<https://eduassistpro.github.io/>

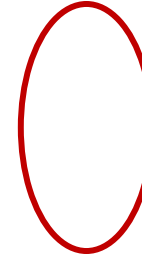

Add WeChat edu_assist_pro

$$P/E = \quad -$$

Abnormal earnings growth (AEG)

Dividend payout ratio

Assignment Project Exam Help

Price-Earnings Ratio <https://eduassistpro.github.io/> combined effects of

- abnormal earnings growth
- dividend payout ratio

Returning to the Market-to-Book (M/B) ratio

from the Abnormal Earnings valuation model +

$$M/B > 1 \quad \rightarrow \quad AE > 0$$

Alternatively, for the Price-Earnings (P/E) ratio

trailing P/E = if $P/AEG > 0$

<https://eduassistpro.github.io/>
Add WeChat edu_assist_pro

$$M/B > 0$$

$$AE > 0$$

$$P/E > \text{normal } P/E$$

$$AEG > 0 \quad \text{i.e., } AE_t > AE_{t-1}$$

Interpretations include –

high (above normal) PB and PE:

→ future abnormal earnings are expected to be positive and increase
i.e., $AE > 0$ and $AEG > 0$

high PB and low PE (below normal):

→ future abnormal earnings are expected to be negative but decrease
i.e., $AE < 0$ but $AEG < 0$

‘confusion’ surrounding M/B as an indicator of a growth stock’ BUT

M/B relates to whether AE is positive or not

P/E relates to whether AE are growing (i.e., $AE_t > AE_{t-1} \rightarrow AEG > 0$)

our interest is in ‘abnormal earnings growth’, not just ‘earnings growth’ !

M/B is not an indication of AEG growth ! (even though high M/B firms are often labelled as ‘growth stocks’)

<p>A High P/B; High P/E</p> <p><u>Nike, Inc.</u></p> <p>The market gave Nike a P/B of 4.1 and a P/E of 21 in 2005, both high relative to normal ratios. Current residual earnings were \$642 million and analysts were forecasting earnings that indicated higher residual earnings in the future.</p>	<p>B Normal P/B; High P/E</p> <p><u>Westcorp</u></p> <p>Westcorp, a financial services holding company, reported earnings for 1998 of 0.65 per share and an ROCE of 5.4%. Analysts in 1999 forecasted earnings of \$1.72 for 1999 and \$2.00 for 2000, which translate into an ROCE of 13.6% and 14.1% respectively. With a forecasted ROCE at about the (presumed) cost of capital but increasing from the current level this is a cell B firm. The market gave the firm a P/B of 1.10 and a P/E of 24.</p>	<p>C Low P/B; High P/E</p> <p><u>Rocky Shoes & Boots, Inc.</u></p> <p>Like Nike, a footwear manufacturer, Rocky Shoes reported an ROCE of 1.8% for 1998 with earnings of 0.21 per share. Analysts forecast an ROCE of 6.2% for 1999 and 7.8% for 2000, on earnings of 0.72 and 0.95 respectively. The market gave the firm a P/B of 0.6 and a P/E of 33, appropriate for a firm with forecasted ROCE less than the (presumed) cost of capital but with increasing ROCE.</p>
<p>D High P/B; Normal P/E</p> <p><u>Whirlpool Corp.</u></p> <p>Whirlpool, with a positive but constant RE was a cell D firm in 1994. Whirlpool was priced at 1 times earnings (cum-dividend), and at 1.8 times book value.</p>	<p>E Normal P/B, Normal P/E</p> <p><u>Horizon Financial Corp.</u></p> <p>Horizon Financial Corp., a bank holding company, reported earnings for 1998 of 0.65 per share and an ROCE of 5.4%. Analysts in 1999 forecasted earnings of \$1.72 for 1999 and \$2.00 for 2000, which translate into an ROCE of 13.6% and 14.1% respectively. With a forecasted ROCE at about the (presumed) cost of capital but increasing from the current level this is a cell B firm. The market gave the firm a P/B of 1.10 and a P/E of 24.</p>	<p>F Low P/B; Normal P/E</p> <p><u>Rainforest Cafe Inc.</u></p> <p>In 1999, analysts covering Rainforest Cafe, a restaurant ("a wild place to eat"), reported earnings of \$0.62 per share for 1999 and 2000, or an ROCE of 1.8% and 2.1% respectively. The stock traded at a P/B of 0.6, reflecting the low anticipated ROCE. The market gave the firm a P/E of 33, appropriate for a firm with forecasted ROCE less than the (presumed) cost of capital but with increasing ROCE.</p>
<p>G High P/B; Low P/E</p> <p><u>US Airways Group</u></p> <p>US Airways reported an ROCE of 81% in 1998. Analysts deemed 1998 to be a particularly good year and forecast ROCE for 1999 and 2000 down to 29% and 33%. The stock traded at 12.6 times book value, consistent with high ROCE in the future, but at a P/E of only 4.</p>	<p>H Normal P/B; Low P/E</p> <p><u>America West Holdings</u></p> <p>America West Holdings, the holding company for America West Airlines had an ROCE of 15.0% in 1998. Analysts forecasted in 1999 that the ROCE would decline to 11.7% by 2000. The market gave the stock a P/B of 1.0 in 1999, in line with the forecasted ROCE equaling the cost of capital. But the P/E was 7, consistent with the expected drop in the ROCE.</p>	<p>I Low P/B; Low P/E</p> <p><u>UAL Corporation</u></p> <p>United Airlines' holding company traded at a P/B of 0.7 in mid-1999 and a P/E of 6. It reported an ROCE of 29.2% for 1998, but its ROCE was expected by analysts to drop to 10.6% (before a special gain) in 1999 and to 9.1% in 2000.</p>

$$\Rightarrow 32,060.9514 + 1,991 = \$34,051.9$$

Add WeChat edu_assist_pro

$$\Rightarrow 34,051.9514 / 491.1 = \$65.28 \text{ per share}$$

Comprehensive Illustration: Nike

After reformulating Nike's financial statements for 2004, an analyst prepares a series of forecast in order to value Nike's shares.

With a thorough knowledge of the business, its customers and the outlook for athletic and fashion footwear, the analyst first prepares a sales forecast.

Then, understanding the product components of cost of good sold, they forecast Nike's gross profit margin.

Adding forecasts of expense ratios – particularly important driver, the advertising-to-sales ratio – they finalise their pro forma income with a forecast of operating income.

Finally, the forecasted balance sheet models accounts receivable, inventory, PPE, and other net operating assets based on their assessment of turnover ratios for these items.

From this process, the analyst arrives at the following forecasts:

Income statement forecasts:

1. Sales for 2005 will be \$13,500 million, followed by \$14,600 for 2006. For 2007-2009, sales are expected to grow at a rate of 9 percent per year.
2. The gross margin of 42.9 percent in 2004 is expected to increase to 44.5% in 2005 and 2006 with the benefits of off-shore manufacturing, but then to decline to 42% in 2007 and subsequently to 41% as labor costs increase and more costly, high-end shoes are brought to market.
3. Advertising, standing at 11.2 percent in 2004, is expected to increase to 11.6% of sales to maintain the ambitious sales growth. The recruitment of visible sports stars to promote the brand will also add to advertising costs.
4. Other before-tax expenses are expected to be 19.6% of sales, the same level as in 2004.
5. The effective tax rate on operating income will be 34.6%.
6. No unusual items are expected or their expected value is zero.

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat: edu_assist_pro

Balance sheet forecasts:

1. To maintain sales, the carrying value of inventory will be 12.38 cents per dollar of sales (an inventory turnover ratio of 8.08).
2. Receivables will be 16.5 cents per dollar of sales (a turnover ratio of 6.06)
3. PPE will fall to 12.8 cents per dollar of sales in 2005 and 2006, from the 13.1 cents in 2004, because of more sales from existing plant. However, with new production facilities coming on line, at higher sales growth, PPE will increase to 13.9 cents on a dollar of sales
4. Holdings of other net operating assets, dominant will be – 6.0% of sales.

Additional Information:

- 2004 NFO = 743
- Terminal growth rate for AE $g = 5\%$
- # Common shares outstanding = 263.1 million
